FOR CULTIVATION ON COCOS SUBSTRATES

- HIGH YIELDS
- PACKED WITH MICROBIOLOGICAL ELEMENTS
- ECOLOGICALLY SAFE
- EFFORTLESS CULTIVATION
- TOLERANT

PACKED WITH MICROBIOLOGICAL ELEMENTS

CANNA COCO is the only unsteamed RHP certified coco substrate. Because of this, CANNA COCO contains a very high proportion of useful microorganisms, including Trichoderma, which combat root rot and other diseases. Trichoderma is also well-known for promoting root growth. Other RHP certified substrates are steam-treated, which kills this protective organism and disrupts the natural balance.

ECOLOGICALLY SAFE

CANNA COCO substrate is an environmentally friendly product based on coconut fibres. No energy wasteful production methods are used during the production of this long-lasting, cultivation medium. Coconut fibres are obtained from the coconuts' husks

which are a natural product that can be harvested throughout the year.

EFFORTLESS CULTIVATION

All the nutrient elements for the growing and flowering phase are present in CANNA Coco A&B. Due to the unique buffering capability of the CANNA COCO substrate, and its sponge-like structure, the nutrients needed to ensure high yields are stored in the coco. This means that the plant itself can regulate the amount and timing of its nutrient intake.

TOLERANT

Coconut fibres have sufficient capillary action to retain enough water and nutrients. This means that the plant can go for longer periods without water, which could happen if a feeding pump was to break down for example.

HIGH YIELDS

CANNA COCO was the first cultivation system that was specially developed for cultivating on coco and has now grown to become the most popular system for both professionals and hobbyists. The sophisticated combination of high value substrates and fertilisers are a guarantee for the best results. Coco growers that really want the best of the best choose CANNA COCO.

CANNA COCO

After years of research into soil, drainage and leaf analysis, CANNA has succeeded in being the first to develop a fertiliser that is specifically tailored to the characteristics of coco substrates. CANNA COCO liquid fertiliser is composed of high value minerals and, in addition to this, CANNA COCO contains natural chelates, humous and fulvic acids which give the plant optimum nutrient absorption. Growers throughout the world have been enthusiastic for years about CANNA COCO's explosive growth and profuse flowering. Thanks to the coco medium's unique buffering qualities CANNA COCO liquid fertiliser is used for both the growth and flowering phases.

CANNA COCO & CANNA COCO Plus substrate

CANNA COCO substrate is a 100% organic product having a fine, uniform structure, free from viruses, chemical additives and soil diseases. The fact that CANNA COCO is not steamed is not the only thing that distinguishes it from other substrates; this is also achieved by the use of pure, first class source materials. Which come from India, where CANNA's production facilities use fresh water only to soak the coco. This to make sure no salt gets in contact with CANNA COCO, ensuring a clean product. Strong root formation, powerful growth and reusability are combined in the CANNA COCO substrate. It also combines the tolerance and organic nature of soil, with the feeding precision when growing in hydroponics. It has a complex balance between water and air which means that it outstrips other substrates. CANNA COCO substrate has been developed and tailored to the needs of the CANNA grower.
